

CASE REPORT

Dynamic management software.

This project is implemented through the CENTRAL EUROPE Programme co-financed by the ERDF.

DYNAMIC MANAGEMENT SOFTWARE.

Summary

The project assumes the creation of software, which would be used for dynamic management implementation and use in an enterprise. It will be used for inputting all of the duties each employee has in a company, (including the top management), as well as to evaluate the functioning of all the company. That will also give chance to set clear goals for each part, employee for the next years and evaluate its execution. This tool is very useful for owners of company and CEOs, who will be able to clearly see what is, and what will be in the company, evaluate its workers as well as implement changes in a company.

Technology

The project assumes the creation of software in python language, that would allow people to benefit the dynamic management theory in practice in easy way.

Development stage

The project is on the stage of development – the whole idea and algorithm is already prepared.

Market/Opportunity

The dynamic management is a modern approach to management, which makes a company more efficient. It gives an opportunity to evaluate the employee's and department's efficiency, which is very good in case of evaluation. Nevertheless the system needs appropriate software, that would make it user-friendly. The software that is being prepared is such a tool, that can be a success in the market.

IP

The IP is necessary at the stage of development. Currently documentation to obtain it is being prepared.
